

# OXCIDETM Treatment for Dairy

---

Entire facility water distribution treatment resulted in descaling of pipes, equipment, machinery, floors, heat exchange surfaces, and removed build up of organic matter.

Facility treatment over 60 days resulted in regular progression of descaling, and increasing ORP values throughout the facility. Descaling was apparent in all areas that resulted in direct cost reduction, chemical usage, maintenance labor, improved efficiency and food safety.

Initial hard deposits on the wall forms within a few days.

60 days after treatment, scale was entirely removed and no new scale was formed.
